Tech Stack

Frontend: NextJS/React

Backend: Django Framework with SQLite database

Database: SQLite

Description of app:

We are building a Steam game review and recommendation application that helps users discover PC games based on their preferences, budget, and system specifications. The application features:

- Browse and search Steam games with reviews
- Filter games by price/review

- See system requirements for each game
- Favorite games and add to wishlist
- Filter by your budget
- View reviews and ratings for each game
- View analytics for the game for a variety of stats:
 - Most Reviewed Games (through steam analytics)
 - Best Valued Game (Derived Calculations determined through price/rating)
 - Most Wishlisted Games (Using our own database of users)

Application Requirements

1. Providing Interactive Features that write data:
 - a. User Creation (Budget, System Specs)
 - b. Users can add games to their wishlist from the games tab
2. Provide at least 3 interactive analytical views
 - a. In our Reviews tab, we have 3 analytical tabs
 - i. Most Reviewed Games
 - ii. Best Valued Games
 - iii. Most Wishlisted Games
